The propagation behavior of ultra-high frequency RF signals

miss-reading: multipath signals destructively combine within ROI

Two Anomalies of UHF RFID Systems

The propagation behavior of ultra-high frequency RF signals

miss-reading: multipath signals destructively combine within ROI

cross-reading: multipath signals constructively combine beyond ROI

Two Anomalies of UHF RFID Systems

The propagation behavior of ultra-high frequency RF signals

How to address miss-reading and cross-reading anomalies simultaneously?

Magnetically-driven UHF RFID Systems

The propagation behavior of magnetic signals

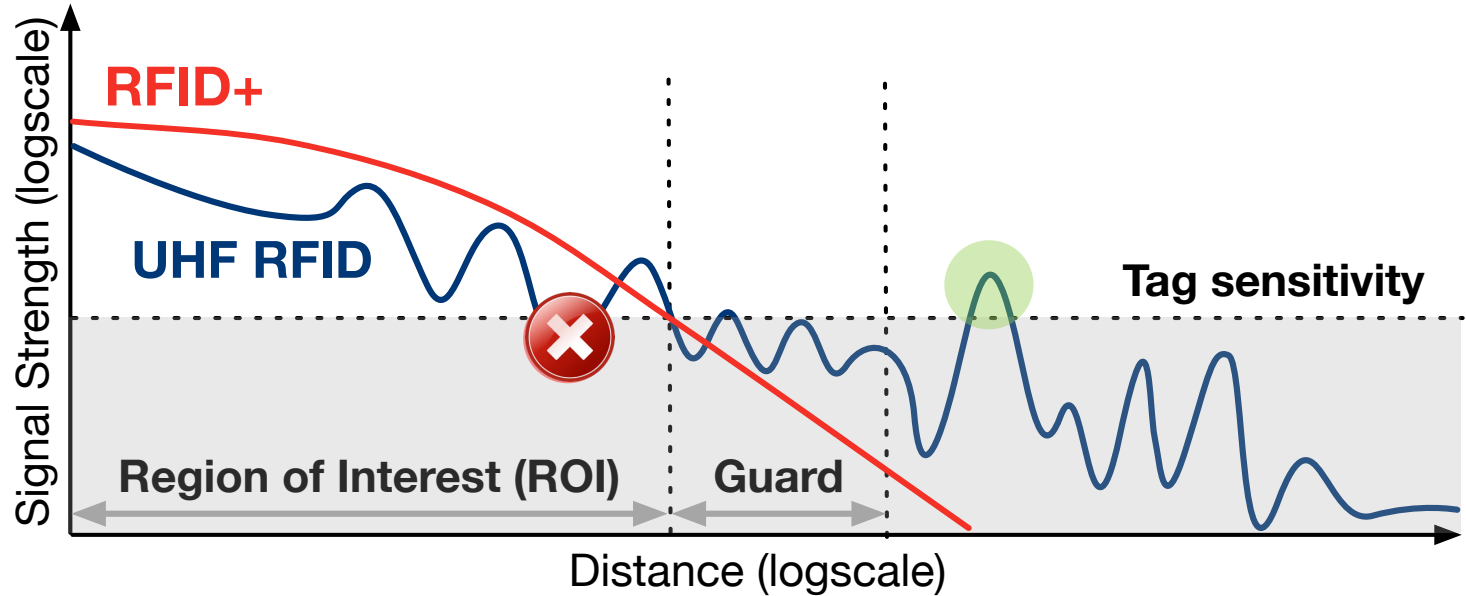

Magnetically-driven UHF RFID Systems

The propagation behavior of magnetic signals

Magnetically-driven UHF RFID Systems

The propagation behavior of magnetic signals

High penetrability: no destructively combined signals within ROI

Magnetically-driven UHF RFID Systems

The propagation behavior of magnetic signals

High penetrability: no destructively combined signals within ROI

Rapid attenuation: no constructively combined signals beyond ROI

Magnetically-driven UHF RFID Systems

The propagation behavior of magnetic signals

Is it possible to utilize a magnetic field in powering the inventory process of UHF RFIDs?

Inductive Coupling via Matching Loops

Every RFID tag inherently incorporates a single-turn coil, i.e., a matching loop.

Inductive Coupling via Matching Loops

Every RFID tag inherently incorporates a single-turn coil, i.e., a matching loop.

Structure of a Typical UHF RFID Tag

10 Popular UHF RFID Tags

Inductive Coupling via Matching Loops

Every RFID tag inherently incorporates a single-turn coil, i.e., a matching loop.

Structure of a Typical UHF RFID Tag

10 Popular UHF RFID Tags

Inductive coupling: the matching loop can capture magnetic field energy and then power the tag for communication.

Preliminary Verification

Experiment Validation

Preliminary Verification

Experiment Validation

- **Tx:** Coil antenna and Patch antenna, respectively

Preliminary Verification

Experiment Validation

- **Tx:** Coil antenna and Patch antenna, respectively
- **Tags:** modified tag whose dipole antenna is cut off

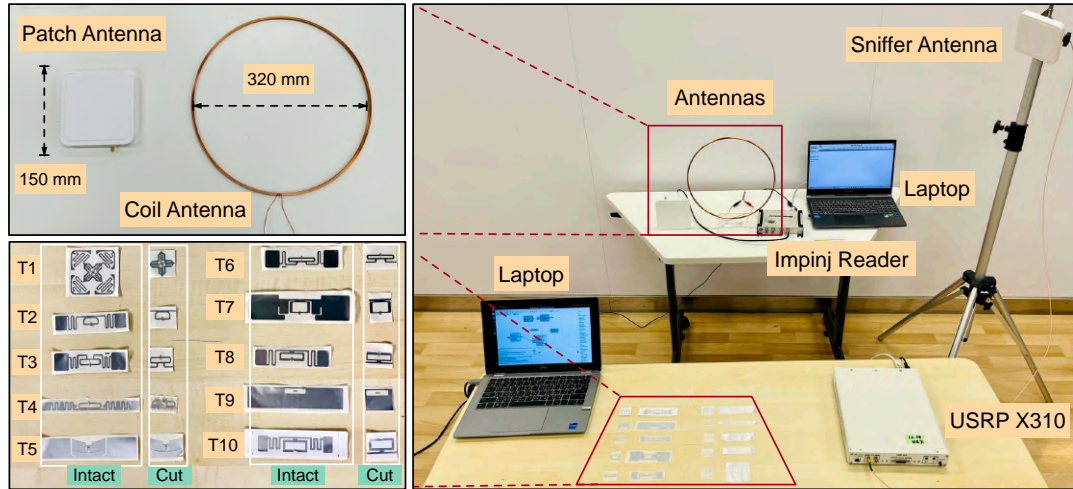

Preliminary Verification

Experiment Validation

- **Tx:** Coil antenna and Patch antenna, respectively
- **Tags:** modified tag whose dipole antenna is cut off
- **Rx:** USRP X310 as Receiver to sniff communication

Preliminary Verification

Experiment Validation

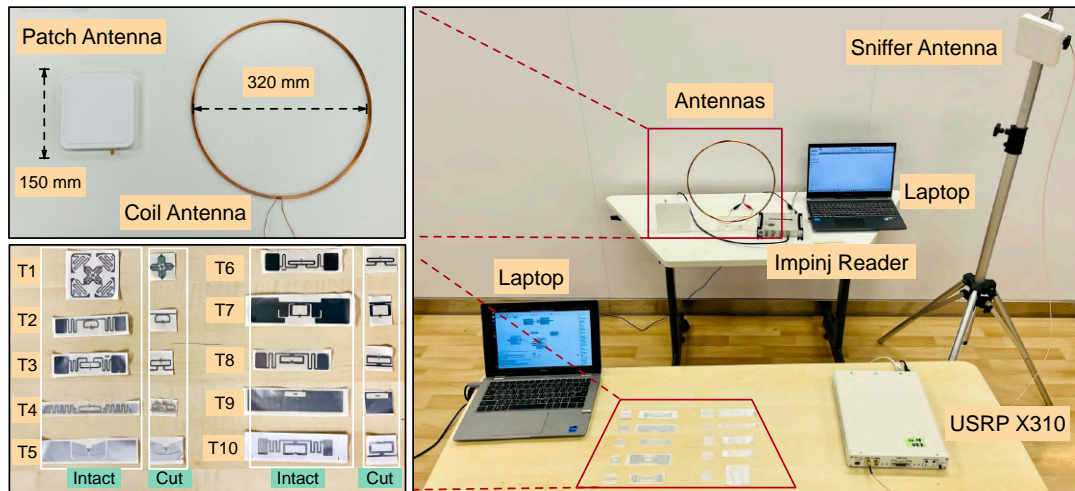

- **Tx:** Coil antenna and Patch antenna, respectively
- **Tags:** modified tag whose dipole antenna is cut off
- **Rx:** USRP X310 as Receiver to sniff communication

Tx: Patch Antenna (Electrical)

No signal can be detected because the tags' dipole antenna is cut off

Preliminary Verification

Experiment Validation

- **Tx:** Coil antenna and Patch antenna, respectively
- **Tags:** modified tag whose dipole antenna is cut off
- **Rx:** USRP X310 as Receiver to sniff communication

Tx: Patch Antenna (Electrical)

No signal can be detected because the tags' dipole antenna is cut off

Tx: Coil Antenna (Magnetic)

Reply signal can be detected even when the tags' dipole antenna is cut off

Preliminary Verification

Tx: Patch Antenna (Electrical)

No signal can be detected because the tags' dipole antenna is cut off

COTS RFID tags can be activated and queried using magnetic fields while the protocol remains consistent

- Tx: Coil antenna and Patch antenna, respectively
- Tags: modified tag whose dipole antenna is cut off
- Rx: USRP X310 as Receiver to sniff communication

Reply signal can be detected even when the tags' dipole antenna is cut off

RFID+

RFID+

- First **spatially controllable** magnetically-driven UHF RFID inventory system

RFID+

- First **spatially controllable** magnetically-driven UHF RFID inventory system
- Introduce techniques for **innovative coil antenna designs** and a **fast inventory algorithm**

RFID+

- First **spatially controllable** magnetically-driven UHF RFID inventory system
- Introduce techniques for **innovative coil antenna designs** and a **fast inventory algorithm**
- Achieves a **99%** discovery rate and nearly **zero** crossing-reading within the region of interest (ROI)

Challenge 1:

How to generate a uniformly distributed magnetic field at the UHF band?

Magnetically Blind Zones at UHF band

Simulated magnetic intensity distribution at HF and UHF bands

Magnetically Blind Zones at UHF band

Simulated magnetic intensity distribution at HF and UHF bands

Wavelength: λ
Coil Perimeter: C

$$\lambda \approx 22\text{m}$$

$$\lambda \gg C$$

HF: 13.56MHz

HF band: the current around the loop **can** remain almost in phase and of the same sign; thus, it **can** produce a uniform strong magnetic field.

Magnetically Blind Zones at UHF band

Simulated magnetic intensity distribution at HF and UHF bands

Wavelength: λ
Coil Perimeter: C

$$\lambda \approx 22\text{m}$$

$$\lambda \gg C$$

HF: 13.56MHz

blind zone

$$\lambda \approx 33\text{cm}$$

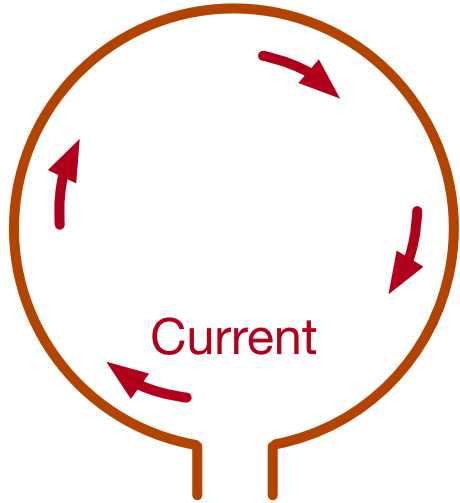

$$\lambda \sim C$$

UHF: 920MHz

UHF band: the current around the loop **cannot** remain almost in phase and of the same sign; thus, it **cannot** produce a substantial magnetic field.

Capacitor-Segmented Coil Antenna

Capacitor-Segmented Coil Antenna

Traditional Coil

Capacitor-Segmented Coil

Capacitor-Segmented Coil Antenna

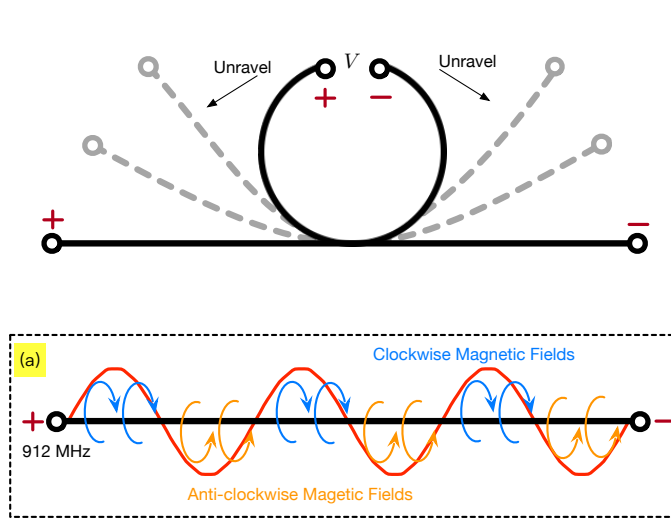

Traditional Coil

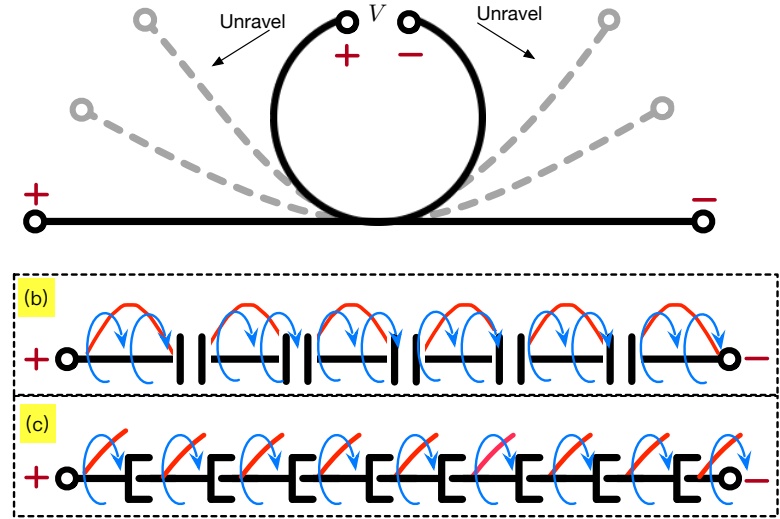

Capacitor-Segmented Coil

Segmenting the loop physically and inserting capacitors between adjacent segments. Each segment can be modeled as an equivalent RLC circuit.

Capacitor-Segmented Coil Antenna

Traditional Coil

Capacitor-Segmented Coil

Such RLC circuits guarantee that the RF signal retains a uniform initial phase shift across segments and no out-of-phase magnetic field is generated.

Capacitor-Segmented Coil Antenna

Traditional Coil

Capacitor-Segmented Coil

The capacitor-segmented coil can maintain the loop's small size while guaranteeing a uniform magnetic field distribution

Multi-turn Spiral Coil Antenna

Multi-turn coils can spread magnetic energy more uniformly

Multi-turn Spiral Coil Antenna

Multi-turn coils can spread magnetic energy more uniformly

One Coil

Multi-turn Spiral Coil Antenna

Multi-turn coils can spread magnetic energy more uniformly

One Coil

Two Coils

Four Coils

Multi-turn Spiral Coil Antenna

Multi-turn coils can spread magnetic energy more uniformly

Prototype

Four Coils

A four-turn design can achieve a balance between maximum magnetic intensity and minimizing the mutual coupling effect among coils.

Side view

Parallel LC circuit

Equivalent circuit

The impedance related to an HIS can be expressed as:

$$Z_{\text{HIS}} = \frac{j\omega L}{1 - \omega^2 LC} = \frac{j\omega L}{1 - (\omega/\hat{\omega})^2} \quad \text{Infinity}$$

The magnetic field's reflected phase by the HIS is $\theta = \text{Im} \left(\ln \left(\frac{Z_{\text{HIS}} - \eta_0}{Z_{\text{HIS}} + \eta_0} \right) \right) \quad \text{Zero}$

At resonant frequency, $\omega = \hat{\omega} \Rightarrow Z_{\text{HIS}} \rightarrow +\infty \Rightarrow \theta \approx 0$

Mushroom-like High-Impedance Surface

HIS reflector

Bird's-eye view

HIS elements

Side view

Parallel LC circuit

Equivalent circuit

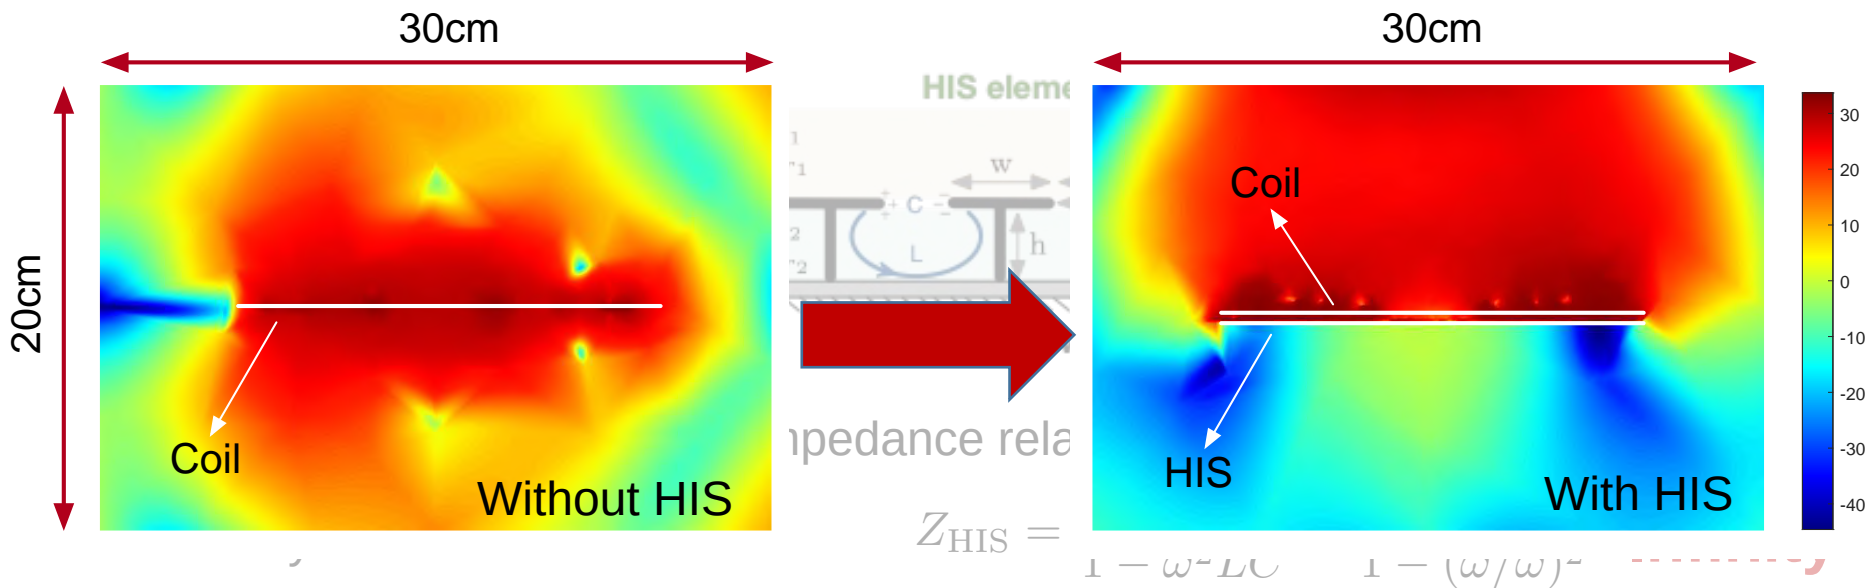

The impedance related to an HIS can be expressed as:

$$Z_{\text{HIS}} = \frac{j\omega L}{1 - \omega^2 LC} = \frac{j\omega L}{1 - (\omega/\hat{\omega})^2} \quad \text{Infinity}$$

The reflected magnetic field has zero phase shift and thus it can constructively combine with the forward-propagating field

At resonant frequency, $\omega = \hat{\omega} \longrightarrow Z_{\text{HIS}} \rightarrow +\infty \longrightarrow \theta \approx 0$

Mushroom-like High-Impedance Surface

The reflected magnetic field has zero phase shift and thus it can constructively combine with the forward-propagating field

At resonant frequency, $\omega = \hat{\omega} \implies Z_{\text{HIS}} \rightarrow +\infty \implies \theta \approx 0$

- **Phase 2:** the **near-field reader** uses previously obtained BF to check for the

The acquisition overhead is reduced by approximately 60% by using Bloom Filter to speed up the inventory process

Implementation

Implementation

- **Reader:** USRP X310 software-defined radios
- **Beamformer:** Raspberry Pi 4 Model B + Phase Shifter (PHSA-152)
- **Tx:** Custom-designed 2×2 coil antenna array + HIS reflectors

Inventory Accuracy

Inventory Accuracy

In the test, a dense collection of 100 tags was fixed to a flat surface. The accuracy was measured based on the discovery rate

Inventory Accuracy

In the test, a dense collection of 100 tags was fixed to a flat surface. The accuracy was measured based on the discovery rate

RFID+ excels in detecting tags within ROI up to 175cm (>95%), and performance significantly declines beyond this range.

Spatial Manipulation

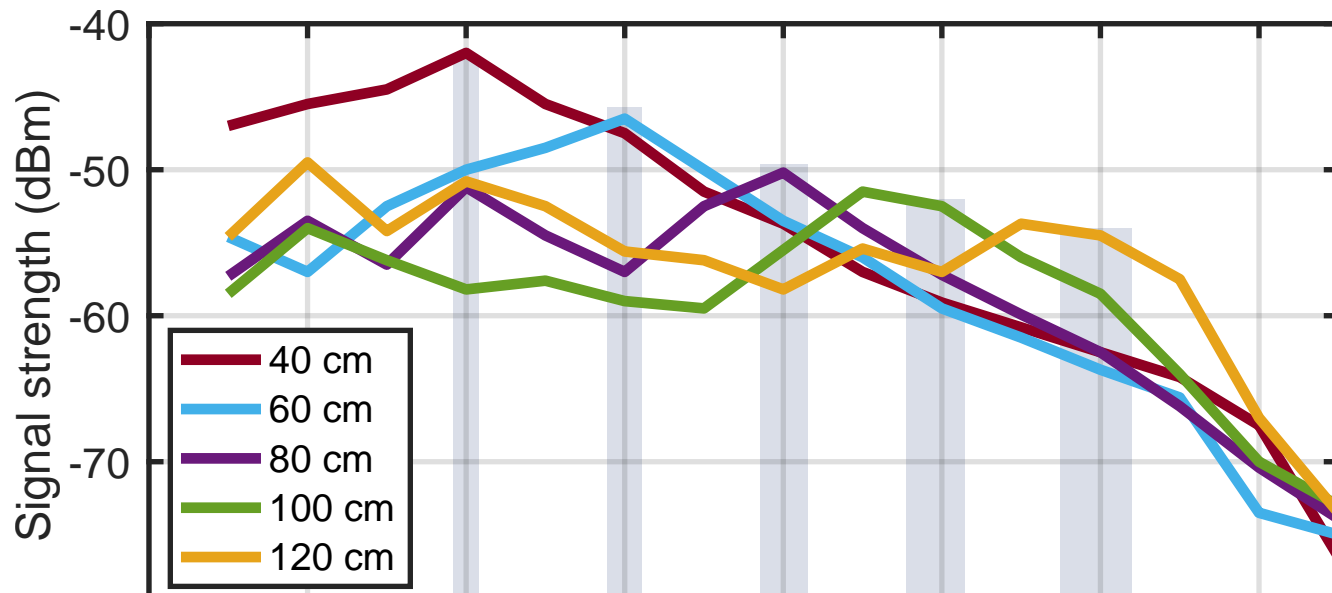

Spatial Manipulation

We directed the beamforming's focus to five positions along the Z-axis. For each position, the tag's backscattered signal strength was measured.

Spatial Manipulation

We directed the beamforming's focus to five positions along the Z-axis. For each position, the tag's backscattered signal strength was measured.

The beamforming focal point increases the average received signal strength by approximately 7.73 dB at these locations.

Inventory Efficiency

Inventory Efficiency

We compared the proposed dual-coupling fast inventory algorithm against the conventional Q-adaptive inventory method.

Inventory Efficiency

We compared the proposed dual-coupling fast inventory algorithm against the conventional Q-adaptive inventory method.

The fast inventory achieves discovery in just 2.4 seconds, saving 36.8% of the time compared to the Q-adaptive algorithm.

Pilot Study: Logistic Network Evaluation

We tested RFID+ in a textile factory warehouse and a conveyor scanning gateway.

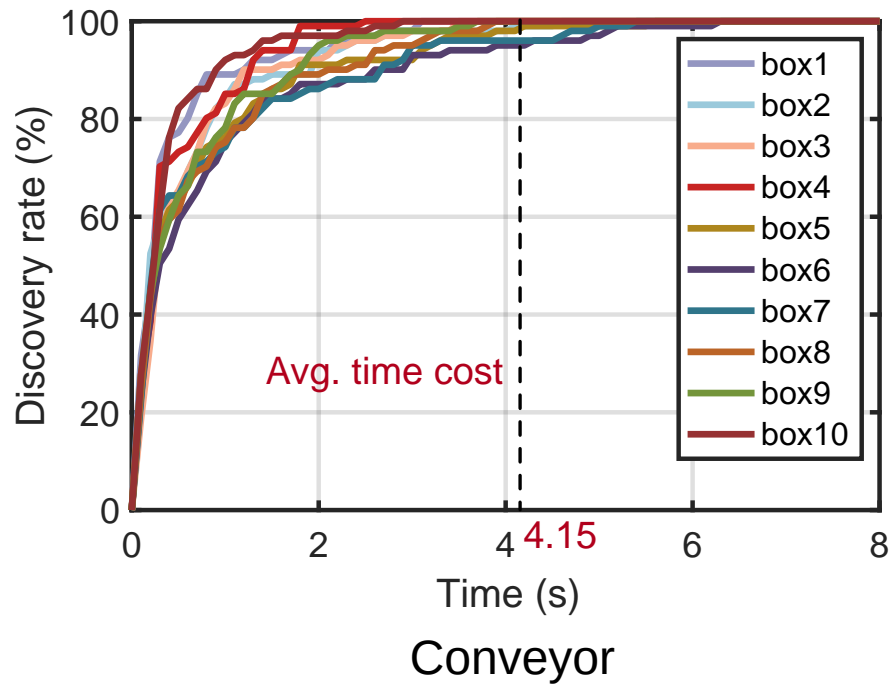

Pilot Study: Logistic Network Evaluation

We tested RFID+ in a textile factory warehouse and a conveyor scanning gateway.

Pilot Study: Logistic Network Evaluation

Pilot Study: Logistic Network Evaluation

Pilot Study: Logistic Network Evaluation

RFID+ achieved about 1.95% miss-reading rate and nearly 0.1% cross-reading rate within a reasonable time slot.

Conclusion

Conclusion

- We first demonstrate that a **magnetically-driven UHF RFID** system is feasible and valuable.

Conclusion

- We first demonstrate that a **magnetically-driven UHF RFID** system is feasible and valuable.
- We first integrate disparate elements (e.g., **capacitor-segmented loops, multi-turn coils, HISs, coil arrays**, etc.) into a unified practical RFID inventory system.

Conclusion

- We first demonstrate that a **magnetically-driven UHF RFID** system is feasible and valuable.
- We first integrate disparate elements (e.g., **capacitor-segmented loops, multi-turn coils, HISs, coil arrays**, etc.) into a unified practical RFID inventory system.
- We achieve a **1.95%** miss-reading rate and nearly **0.1%** cross-reading rate in a pilot study.
